

AICP Engineering

Governed execution, evidence and human authority.

Problem

Uncontrolled agents can change workflow, exceed budget, leak credentials and produce unverifiable outcomes.

Authority model

Harness owns workflow, budget, authorization, gates and termination. LLMs are untrusted executors.

Architecture

Console → BFF → Harness → Worker / Knowledge / PostgreSQL. Workers reach providers through LiteLLM only.

Run lifecycle

Authenticate → reserve → compile context → isolate worktree → execute → reconcile → gate → human review → cleanup.

Execution isolation

One run, one worktree, one ephemeral worker, one revocable workload identity.
