

AI Engineering Control Plane

Governed execution for AI-assisted software engineering.

The problem

Fast AI assistance without authority, budget, isolation and evidence creates operational and compliance risk.

The proposition

A human control plane that governs execution, context, memory, security and release readiness.

One glance architecture

Console → Harness → isolated workers; PostgreSQL is canonical; providers sit behind LiteLLM.

Evidence and security

Every stage is bounded and auditable. Scanners and CI remain deterministic authorities.

Economics and evaluation

Budget reservations, physical reconciliation and paired evaluation make cost and quality measurable without inventing SLOs.
